

Carbon Technology

Utilised for several hundred years, carbon is considered one of the oldest means of water purification. Although impossible to trace the exact date and time, there is evidence of its usage and importance throughout history, from the ancient world to the modern era.

How Carbon Works

The cross-section below exposes the huge network of cracks and micropores that determines carbon's effectiveness at removing a wide range of contaminants.

Particle Filtration Sediment and Suspended Solids

Every carbon block cartridge has a given micron rating to indicate the physical size of suspended particulate that can be removed by the cartridge. To prevent premature sediment blockage before the chlorine capacity of the carbon has been exhausted, pre-filtration, such as the SPECTRUM SSP or PSP, is recommended to prolong the life of the cartridge.

Adsorption Organics and Heavy Metals

Carbon is a naturally adsorptive media, removing dissolved contaminants from a solution. When heated to 870°C, during the activation process, millions of tiny micropores are created throughout the structure of the cartridge, attracting large organic molecules and heavy metals to the surface.

Chemical Reaction Chlorine and Chloramine

Through chemical interactions with the activated carbon, reactive chlorine molecules are converted to less reactive chloride ions. Chloramine can also be removed through this process although the reaction occurs at a much slower rate. Speciality cartridges such as the SPECTRUM PCB have been specifically designed to effectively target chloramine.

Carbon Flow Rate

The longer water comes into contact with carbon, generally the more effective the treatment process will be, whether removing organics, heavy metals, chlorine or chloramine. Even a small increase over the recommended flowrate can cause dramatic decreases in carbon treatment's effectiveness. Therefore it is imperative to size a carbon treatment system properly, ensuring that the flowrate allows enough contact time to remove the undesired contaminants. The recommended flowrate for each cartridge is shown on the product page (as illustrated, right).

		@ Flow Rate (LPM)	
		3.8	7.6
Max. Operating Temp. 52°C		7.6	7.6
Max. Operating Pressure 2.5 bar		7.6	7.6
SCB Properties			
Flow Rate (LPM)	Chlorine Reduction (L) @ 0.2ppm	Pressure Drop (Bar) @	Flow Rate (LPM)
3.8	113,750	0.3	3.8
7.6	227,500	0.3	7.6
7.6	356,850	0.4	7.6
15.1	713,700	0.4	15.1

Carbon's Effectiveness at Removing...

Excellent

- Chloramine
- Chlorine
- Dyes
- Glycols
- Herbicides
- Hydrogen Peroxide
- Insecticides
- Iodine
- Odours
- Oil-dissolved
- PCBs
- Pesticides
- Sodium Hypochlorite
- Taste
- THMs

Good

- Organic Acids
- Organic Salts
- Potassium Permanganate
- Solvents
- Sulphonated Oils
- Tannins

Fair

- Acetic Acid
- Detergents
- Heavy Metals
- Hydrogen Sulfide
- Plating Wastes
- Soap

Carbon Cartridge Construction

From raw material, through to activation and end product.

Modified Carbon Block

e.g. CFB-Plus

An advanced technology, Fibredyne combines dissolved contaminant removal with excellent sediment reduction. Uses powdered carbon for effective chlorine reduction.

Powder Carbon Block

e.g. SCB & PCB

Finer carbon mesh size increases surface area, ensuring highly effective removal of small contaminants such as chlorine. Perfect for drinking water applications.

Granular Carbon Block

e.g. CB & ECB

Traditional carbon technology, more effective at removing large molecules such as odours. Suitable for commercial and industrial applications.

For **Chlorine**
and **Organics**

Chlorine Reduction

Typical Life in UK
Water (L)*
48,000

Performance based on 10" cartridge. *Life in UK water based on free chlorine concentration of 0.2mg/l.

870 Carbon Block - Economic Batch Process Applications

Suited to the industrial sector, the lower capacity ECB suits batch process, where a longer service life is not required. For 2019, the carbon formulation has been upgraded, significantly improving chlorine removal efficiency to 60% from 35%, serving for a more reliable and dependable economic block. Manufactured using acid washed bituminous

carbon, a highly microporous structure targets larger organic molecules such as benzene. This ensures the removal of ash and reduces rinse-up fines often found with non-acid washed bituminous carbon. Available in 3 micron sizes, the ECB offers flexibility to suit different applications where sediment could plug the carbon before service life is achieved.

Key Features

- Upgraded for 2019, new formula ECB with chlorine reduction efficiency levels of 60%
- Robust, due to high binder content
- The highest micron size available in the economic range prevents blinding of cartridge

Typical Applications

- Low capacity industrial batch processes
- Small RO applications where cost is of primary consideration

* Bituminous carbon is not suitable for drinking water. For an alternative, please refer to the WRAS approved SCB on page 10
